Retaining Wall Rehab

Failing retaining walls are a common problem owners and property maintainers face. In many cases these are removed and replaced at a high cost when they could be stabilized-in-place. ECI has dozens of successful projects stabilizing retaining walls of all types: Cast-in-place concrete, precast, MSE, stone / rubble, wood, and sheetpile. We typically employ one or more of the following techniques: soil nails, dead-men anchors, steel mesh, single-face concrete overlay, shotcrete, or cast-in-place buttresses. Give us a call to discuss your wall and we can help come up with a solution.

Check out some of ECI's recent projects on social media!
